Overcoming Challenges	4

Good Poultry Health is one of the major factors, which needs special consideration when it comes to the economic growth and development of a country. The poultry industry can directly relate to the economic growth of a country as it is a source of production of meat, eggs, and feathers. These are the food items widely consumed by people and play a vital role in day-to-day life. Poultry health and diseases are the most common aspects, which cannot be neglected. For poultry health status determination, you must be able to understand what is "normal." Many diseases look alike and produce the same symptoms and signs, so it might become difficult sometimes to determine what is wrong. But, A failure of early detection could be catastrophic.

Food Security

The food security enhancement of a stable local poultry production is paramount to the economy of a population.

Exports

With a sizable local poultry industry, the ability to augment GDP through poultry exports becomes an option.

Cost Controls

With a healthy local poultry industry costs remain relatively stable across the poultry consumer market for that area.

The health of the poultry animals is one of the prominent and key aspects to track for the growth of the industry. If the animals or the birds are not in good health condition, it can lead to various other issues, and can directly impact the development as well as production.

Keeping track and the regular monitoring of the health status of animals is an easy way to avoid risk. This way, you can initially sense if there is something wrong, and you can take the essential precautionary measures.

Why is this important?

Because "Everyone Eats Chicken" 65 billion chickens are consumed each year globally. Early detection of infectious diseases plays a crucial role in all disease prevention and food security strategies. This is in a wide array of foods that we consume, these are the foods our families gather around the table for. The care and concern for the foods our families are eating is paramount and is a reflection of our needs. Our needs is where we generally spend the most of our income thus the economic correlation.

Food Spend

The global average on food spend is nearly 50% of individual income or earnings.

Impacts of health?

In developed countries, the poultry industry plays a huge role and is considered a gigantic industry. It means a very large portion of the economy of most countries like the US, rely on the poultry industry. The economic aspects are becoming more intense with the rise in production, and the demand for poultry items in the market. The broiler and eggs are the high-demand poultry items, within the food industry, and it is highly consumed. A large outbreak could have significant and lasting effects throughout.

A slight loss in production or efficiency can contribute to a great loss in the economy, and a country can experience billions of dollars of loss. Improving the quality of production, efficiency, and keeping the animals in good health are a few factors that can prevent this loss.

You Can't Do This Alone

Mentioned above are only a few common challenges that the health industry faces, the only thing that matters is to find appropriate ways to overcome these issues to avoid big risks. First things first are the health issues, that the poultry animals face. The good health of the poultry animals is one of the prominent factors, that can overcome the economic loss. For this, you must hire a team of experts or take assistance from a professional veterinarian, to follow the right path.

The second common issue that a poultry industry can at times face is poor climatic conditions. It is advised to set the ideal temperature for the poultry animals, so they can survive, and grow for better production. Last but not the least, is the diseases, and infections that are common along with the poultry industry. Disease control is essential to do for the betterment and economic growth of the poultry industry. The diseases can be controlled by vaccinations, parasite control, and by separating the ill birds or animals. A key part is to have an early detection operation or solution.

At PrecisaAG it is our mission to deploy the latest technologies to facilitate a stable and healthy local poultry industry on a global scale. We have deployed a solution powered by Artificial Intelligence and made it available to the world.
